A Rakaca – patakvidék edényes flórája

A szakirodalom által Tornense flórajárásba sorolt és mindössze 4,73 km² kiterjedésű / aminek közel felét is a Rakaca – víztároló adja/ vidéken saját kutatásaink, valamint a csekélyszámú és nagy részben új keletű forrásmunka eredményeként eddig 542 faj jelenléte bizonyosodott be. Ez a szám természetesen nem tekinthető véglegesnek, ám az adatok így is számos új és jelentős ismeretet szolgáltatnak ezen az egyveretűnek tűnő tájon. Az Észak-Magyarországi-Középhegység e részére 63 faj /11,6%/ bizonyult újnak, innen eddig ismeretlennek. Ritkának, azaz a 22 vizsgálpont közül 1-5-ben jelenlévő és többnyire csekély állományúnak 250 fajt /46, 0%/ találtunk. Ugyanakkor a 245 nemzetség közül fajokban a leggazdagabbak a *Carex* /hibridekkel együtt 39/, *Salix* /hibridekkel együtt 10/, *Galium* /9/, *Veronica* /9/, majd 8-8 fajjal a *Ranunculus*, *Potentilla*, *Trifolium*, *Rumex*, és *Juncus* nemzetségek, végül 7-7-el a *Cirsium* és *Festuca* valamint az *Epilobium* /6/. Ezek többsége / *Potentilla* és *Veronica* fajok kivételével / a vizes-nedves élőhelyeket kedveli, viszont felerészben előfordulás és állomány nagyság tekintetében nem számítanak gyakorinak.

A Rakaca- patakvidék flórajának összetevői között 41 olyan fajt /7,6%/ találunk, amelyek a szomszédos hegyek, dombok erdői irtásrétegeinek jellemzői, onnan származtathatóak, míg 21 faj /4,6%/ alföldi eredetű. Az ebbe a csoportokba tartozók legtöbbje ritkának számít.
